

WHAT IS CLAIMED IS:

1. (currently amended) A flat sheet material for manufacturing leaf-like sheets (1) for receiving information, the sheet material comprising:
a coating applied onto a substrate, wherein the coating comprises at least a first layer;

particles embedded in the first layer;

wherein the particles are electrically activatable particles, magnetizable particles or electrically activatable and magnetizable particles;

wherein by at least one of activation and magnetization of the particles when arranged in at least one of an electrical and a magnetic field, information is writable, retrievable and changeable on the sheet material;

fine cavities provided in the coating;

wherein the cavities are filled with a dye;

wherein the sheet material is stacked with a second sheet material comprising a dye coreactant to form a carbonless set.

3. (canceled)

4. (canceled)

5. (previously presented) A flat sheet material for manufacturing leaf-like sheets for receiving information, the sheet material comprising:

a coating applied onto a substrate, wherein the coating comprises at least a first layer;

particles embedded in the first layer;

wherein the particles are electrically activatable particles, magnetizable particles or electrically activatable and magnetizable particles;

wherein by at least one of activation and magnetization of the particles when arranged in at least one of an electrical and a magnetic field, information is writable, retrievable and changeable on the sheet material;

fine cavities provided in the coating, wherein the first layer containing the particles comprises the cavities;

wherein the particles are embedded between the cavities in the first layer.

6. (canceled)
7. (canceled)
8. (previously presented) The sheet material according to claim 1, wherein the carbonless set is configured as an endless set comprising a perforated tractor edge.
9. (previously presented) The sheet material according to claim 1, wherein the carbonless set is embodied as a multi-part form set.
10. (previously presented) The sheet material according to claim 5, wherein the cavities contain fragrances.
11. (previously presented) The sheet material according to claim 5, wherein the cavities contain adhesives.
12. (previously presented) The sheet material according to claim 5, wherein the sheet material is divided into different zones and wherein the cavities in the different zones are filled differently.
13. (previously presented) The sheet material according to claim 5, wherein a contents of the cavities can be released by activation of the particles.
14. (canceled)
15. (canceled)
16. (previously presented) The carbonless set according to claim 42, wherein the magnetizable particles are comprised of chromium dioxide.
17. (previously presented) The carbonless set according to claim 42, wherein the magnetizable particles have a grain size of smaller than approximately 2 to 3 micrometer.
18. (previously presented) The carbonless set according to claim 42, divided into partial areas wherein one of the partial areas is a reading/writing area.
19. (previously presented) The carbonless set according to claim 18, wherein the reading/writing area is marked by printed markings.
20. (previously presented) The carbonless set according to claim 18, cut to a sheet with a standard basic surface area.
21. (previously presented) The carbonless set according to claim 20, wherein

the standard basic surface area matches DIN sizes.

22. (previously presented) The carbonless set according to claim 42, wherein the substrate is a paper layer.

23. (previously presented) The sheet material according to claim 5, wherein materials employed for manufacturing the sheet material are heat-resistant.

24. (previously presented) The sheet material according to claim 1, comprising a self-adhesive strip.

25. (currently amended) A flat sheet material for manufacturing leaf-like sheets (4) for receiving information, the sheet material comprising:

a coating applied onto a substrate, wherein the coating comprises at least a first layer;

particles embedded in the first layer;

wherein the particles are electrically activatable particles, magnetizable particles or electrically activatable and magnetizable particles;

wherein by at least one of activation and magnetization of the particles when arranged in at least one of an electrical and a magnetic field, information is writable, retrievable and changeable on the sheet material;

fine cavities provided in the coating; and

wherein the sheet material comprises strip conductors.

26. (previously presented) The sheet material according to claim 25, wherein the strip conductors are comprised of electrically conducting particles.

27. (previously presented) The sheet material according to claim 25, comprising several reading/writing areas, wherein at least one of the strip conductors is connected to each one of the reading/writing areas, respectively.

28. (previously presented) The sheet material according to claim 27, wherein the reading/writing areas are connected by the strip conductors to a microchip embedded in the sheet material.

29. (previously presented) The sheet material according to claim 25, comprising an antenna for data exchange with the particles.

30. (previously presented) The sheet material according to claim 29, wherein the antenna is applied onto the sheet material by printing.

41. (canceled)

42. (previously presented) A carbonless set for storing optically and magnetically recognizable data, the carbonless set comprising:

a flat leaf-like sheet comprising at least one coating applied onto a substrate;

magnetizable particles embedded in the at least one coating;

wherein by magnetization of the particles when arranged in a magnetic field, information is writable, retrievable and changeable on the carbonless set.

43. (previously presented) The carbonless set according to claim 42, wherein the at least one coating containing the magnetizable particles or an additional coating has cavities in the form of microcapsules.

44. (previously presented) The carbonless set according to claim 43, wherein the microcapsules contain a dye and, when the microcapsules are caused to burst, the dye interacts with a dye coreactant and is made visible.

45. (previously presented) The carbonless set according to claim 42 in the form on an endless set having a perforated tractor edge.

46. (previously presented) The carbonless set according to claim 42 in the form of a multi-part form.
